

# New project

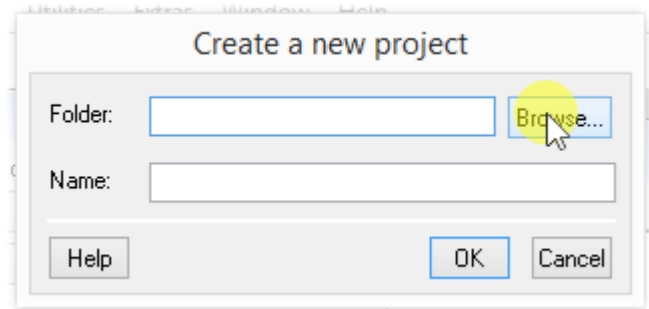

To create a new project one has to first create a folder in which it will be placed. From the program's level it can be done by going to **Utilities->Create a Folder**.

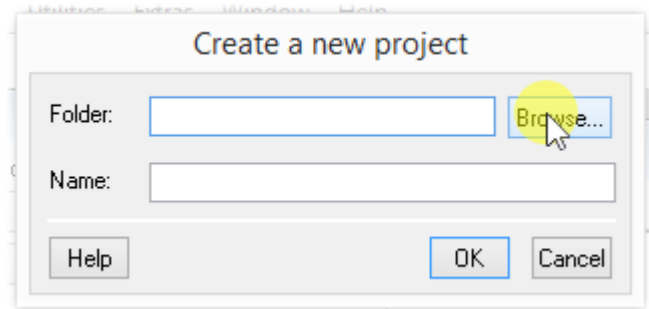

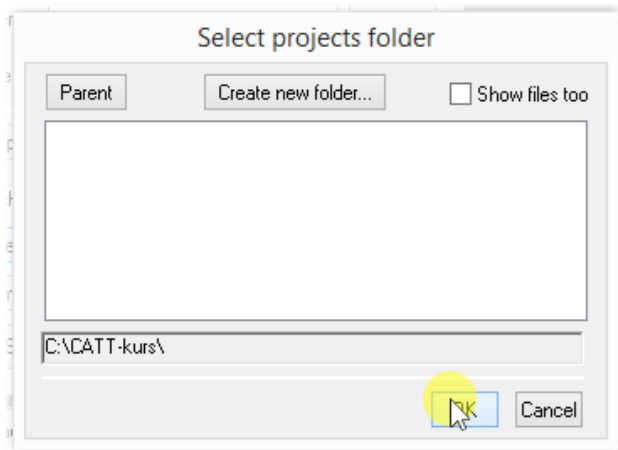

For the sake of this course the folder called CATT-kurs (a translation of CATT-course into Polish) has been placed directly on C:

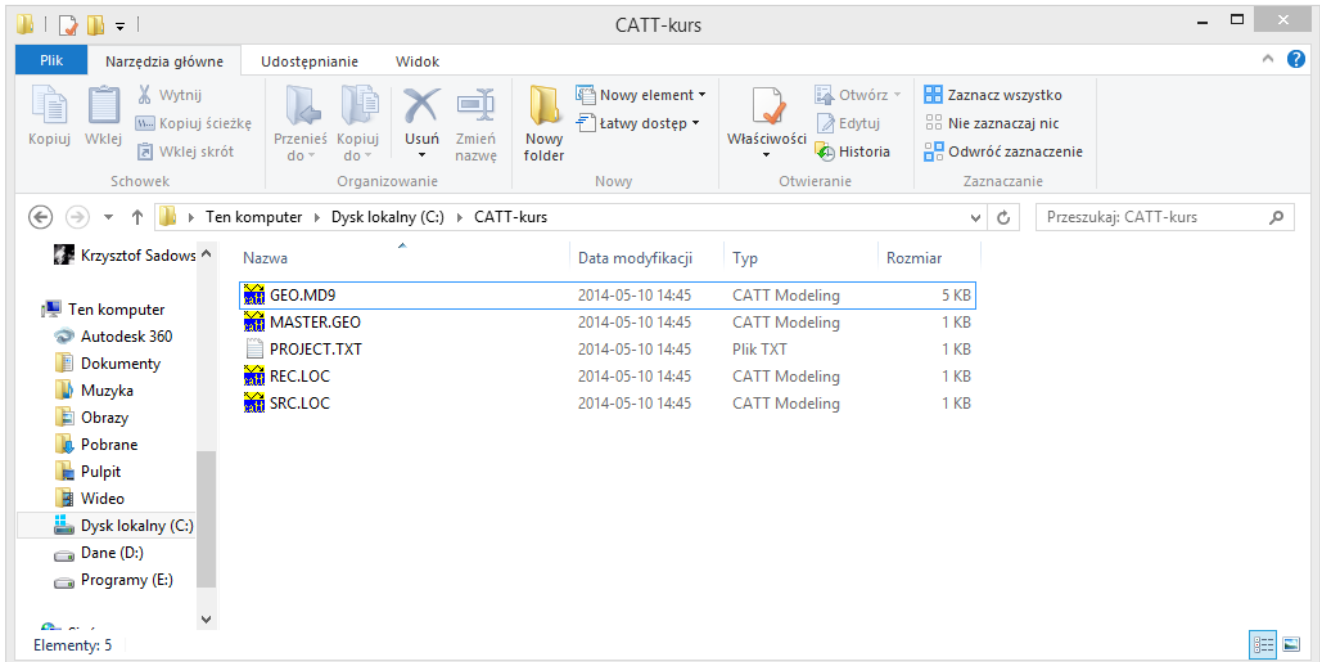

Next it is required to create a new project by going to **Utilities->Create a New Project**:

We choose a created folder, give the new projects name and accept the changes:

Five new files appeared in a folder of our choice:

**GEO.MD9** - a file containing the project's properties

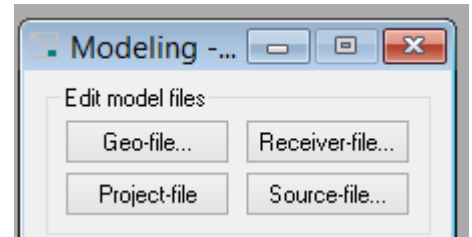

**MASTER.GEO** - the main file containing the model's geometry

**SRC.LOC** - distribution and parameters of the sound sources

**REC.LOC** - distribution of receivers

**PROJECT.TXT** - additional info about the project - date, place, authors

They can be opened in CATT-Acoustic's internal editor (Modeling window):

Or in any other text editor, so long we don't forget not to change the file's extension...
